4 Burner recirculating

TANKLESS
WATER HEATER

To recirculate let grains set for about 10 minutes after doing in. Then turn the pump on and open the valve until wort is just starting to flow. Vorlauf at this phase for about 5 minutes and then start opening up the valve a little at a time until the desired recirculating rate is achieved. At this point it's safe to turn the heat switch to the on position. Let the PID controls maintain the setpoint temperature that you previously set. Check the grain bed now and again to make sure it is not compacting to much and getting stuck.
